

10. Using Angular JS create a SPA that show top ten software features

Here is an example of how you could create a single-page application (SPA) using AngularJS that shows the top ten software features:

```
<div ng-app="myApp" ng-controller="featuresController">
  <h1>Top 10 Software Features</h1>
  <ol>
    <li ng-repeat="feature in features">{{feature}}</li>
  </ol>
</div>
```

```
<script>
angular.module('myApp', [])
.controller('featuresController', function($scope) {
  $scope.features = [
    "User-friendly interface",
    "Easy installation and setup",
    "Regular updates and patches",
    "Customization options",
    "Multi-platform support",
    "Integration with other software",
    "Data security and privacy features",
    "Scalability",
    "Good documentation and support",
    "Affordable pricing"
  ];
});
</script>
```

This code defines an AngularJS app and controller, and uses ng-repeat to iterate through the features array and create a li element for each element in the array. The {{feature}} expression binds the value of the current element to the li element.

The resulting output would be:

Top 10 Software Features

1. User-friendly interface
2. Easy installation and setup
3. Regular updates and patches
4. Customization options
5. Multi-platform support
6. Integration with other software
7. Data security and privacy features
8. Scalability
9. Good documentation and support
10. Affordable pricing
