8.Write HTML code using AngularJS to generate the following output

i.BCA

ii.BCA

III. MCA

IV. BBA

V.MBA

VI.M.Com

Here is an example of HTML code that uses AngularJS to generate the output you specified:

```
<div ng-app>
  <ol>
    <li ng-repeat="degree in degrees">{{degree}}</li>
  </ol>
</div>

<script>
  angular.module('myApp', [])
    .controller('myController', function($scope) {
     $scope.degrees = [
       "BCA",
       "BCA",
       "MCA",
       "BBA",
       "MBA",
       "M.Com"
     ];
    });
</script>
```

This code defines an ol element and uses ng-repeat to iterate through the degrees array and create a li element for each element in the array. The {{degree}} expression binds the value of the current element to the li element.

The resulting output would be:

```
i. BCA
ii. BCA
iii. MCA
iv. BBA
v. MBA
vi. M.Com
```
